PRODUCT · PER-QUESTION DEPTH

Same minutes. Different signal.

Every question in a screening call doesn't deserve the same amount of time. Talvin AI lets you decide which ones do.

Talvin

THE DEFAULT IS BROKEN

One timer for every question

Most screening tools give every question the same follow-up budget — whether it’s a warm-up or the one skill that decides the hire. That’s not consistency. It’s a missed signal on the question that actually matters.

Talvin

HOW IT WORKS

Four levels. One config.

1 **Set depth per question.** Low, medium or high — configured once, per role.

2 **Low questions get one pass.** Sally moves on once the answer is clear.

3 **High questions get curveballs.** Follow-ups, edge cases, a harder version of the same problem.

4 **The transcript shows the depth used.** Recruiters see exactly where the probing happened.

Talvin

WHY IT MATTERS

Depth is what validity needs

Structured interviews with fixed questions predict performance at 0.38. Calibrating depth to what each question actually tests is how task-based screening closes that gap.

0.38	Low–High	1
fixed-question ceiling	depth per question	config per role

Talvin

WHAT RECRUITERS CONTROL

Set it once per role

A technical screen for a senior engineer runs high depth on system design, low on culture questions. A frontline hire runs high depth on a difficult customer scenario, low on availability. The config travels with the role, not the recruiter.

Talvin

ALREADY IN PRODUCTION

Built into every screen

Per-question depth ships as a standard step in the interview builder recruiters already use to write questions — no extra setup, no separate tool to configure.
