

The interview you trust predicts almost **nothing**

The real data behind AI voice screening accuracy — and the number most hiring teams never see.

WHAT "ACCURACY" MEANS

"Accurate" is **four** questions, not one

Most vendors answer one and call it proof. The real ones answer all four:

Do candidates respond honestly, or do they clam up for a bot?

Does the score predict on-the-job performance, or just who interviews well?

Does it hold up at live volume, not in a demo?

Would a regulator's security team sign off on it?

 PREDICTIVE VALIDITY

0.14

The predictive validity of the unstructured interview — the format most companies still hire on. On a scale where **1.0** is perfect, that is barely above guessing.

THE CONTRAST

0.55–0.63

Structured job simulations — measuring the work, not the small talk. Simulate the role and the number nearly quadruples:

0.55–0.63 Structured job simulation

0.38 Structured interview

0.14 Unstructured interview

The "proven" process is the **weakest** one

Everyone asks AI screening to prove itself. Almost nobody asks the resume pile to.

Over 70% of first-round screens are with candidates who were never qualified. Keyword-matching a CV isn't more validated than a blind test or a predictive-validity study.

It's less. It just predates the scrutiny.

THE EVIDENCE, NOT THE PITCH

Measured on **real** hiring

94%

of candidates in a blind test couldn't tell the AI from a human recruiter

150 / 5

candidates screened in 5 days at one Sri Lankan conglomerate — a 4–5 week job

Board

IT approval cleared at one major bank after a full security review

YOUR MOVE

Make every vendor prove it

Real production data or a controlled demo? Predictive validity or just engagement metrics? A passed security review or a claim of "enterprise-ready"? Ask before you sign — including us.

Book a demo — run it on a role you're hiring for now
