

Everyone says **accurate**. Almost nobody proves it.

The data behind AI voice screening —
pulled from real deployments, not a pitch
deck.

THE PROBLEM

"Accurate" means **four** different things

Can candidates tell it's AI. Does it predict job performance. Does it hold up at real hiring volume. Would a regulated bank's compliance team actually sign off on it.

 THE DATA

94%

of candidates in a blind test could not tell the interviewer was AI. Genuine responses are the only data worth measuring accuracy on.

— PREDICTIVE VALIDITY

0.55–0.63

Structured job simulations score here. Unstructured interviews — still the format most companies run today — score 0.14.

We tested it on ourselves

488 resumes narrowed to 15 finalists in a week.
Screening time cut 80%. Not an outside case study
— our own hiring team, running our own product.

 THE BASELINE

Resume screening isn't **validated** either

Keyword matching has no predictive validity score at all. Over 70% of screening interviews today are conducted with candidates who turn out unqualified.

Ask your vendor for the **number**, not the pitch

Predictive validity, blind-test results, compliance sign-off. Full breakdown below. Link in comments ↓
