PREDICTIVE VALIDITY · 2026

Most interviews are a coin flip

Structured, unstructured, panel — the format was never the problem. The scoring was.

Talvin

THE RESEARCH

Three formats, one score

Unstructured interviews predict job performance at 0.14. Structured interviews get you to 0.38 — better, barely. Scenario-based assessments that test real task performance land at 0.55–0.63.

Talvin

WHY IT STAYS LOW

70%

of screening interviews in APAC are run on candidates who were never going to be a fit. Resumes get keyword-matched, not tested — so the interview spends its best minutes confirming what a CV already claimed.

Talvin

BUILT FOR ONE ACCENT

Most tools weren't built for your candidates

Most AI screening tools were trained on North American and European English. Applied to Sri Lankan, Filipino, Indian or Vietnamese English, transcription accuracy drops — and a genuinely qualified candidate gets miscategorized by a tool that was never built for them.

Talvin

WHAT CHANGES THE NUMBER

Test the job, not the interview

Job Tryouts place candidates inside a realistic scenario — a hard customer call, a technical objection — and measure what they actually do. That’s the validity jump from 0.38 to 0.55–0.63.

Talvin

ALREADY IN PRODUCTION

The numbers are real

87% of candidates rate the Job Tryout experience good or excellent, against 62% for a traditional interview. Companies using it see 30–45% less turnover in the first year.
