

The bar just moved to **agentic**.

Voice stopped being the differentiator. Here's what actually separates hiring platforms now.

WHAT CHANGED THIS QUARTER

Everyone can **talk** now.

HireVue shipped a two-way interviewer scored against IO-validated rubrics. Ribbon wired itself into six ATS platforms and rebuilt as an "operator" layer. HeyMilo launched three new agents in the same quarter.

Voice, industry-wide, is a solved problem.

WHAT "AGENTIC" ACTUALLY MEANS

Judgment, not a script.

Agentic means the AI decides what to ask next — a contextual follow-up, a deliberate curveball, more depth on the skill that actually matters. A voice tool reading fixed questions out loud isn't agentic. It's a script with a nicer voice.

— THREE CATEGORIES, ONE REAL ONE

Static. Scripted. Agentic.

Traditional video AI scores a fixed recording — no adaptation, ever. Chatbot screeners run a linear script — easy to game. Agentic recruiting adapts in real time and probes a weak answer before it ever reaches a recruiter.

— BLIND-TESTED

94%

Of candidates in blind testing couldn't tell Talvin's Sally apart from a human recruiter, based on the conversation alone. That's what agentic depth sounds like from the other side of the call.

The funnel runs itself.

Invites, reminders, follow-ups, shortlisting — Talvin runs the full screening funnel inside Ashby, Greenhouse, Workday and Zapier, with no recruiter triggering each step. One management trainee programme used it to take 460+ applications down to a shortlist of 10.

YOUR MOVE

Ask one question at the **next** demo

"What does your AI ask after a good-sounding answer?" If the honest answer is "moves on" — it isn't agentic. It's a script.

Book a demo — watch Sally probe past the rehearsed answer
