

Voice AI is now table stakes.

Every serious platform in the category runs a two-way voice interview. The gap is somewhere else.

WHAT CHANGED

Voice shipped everywhere this quarter.

A large enterprise HR platform launched a two-way voice interviewer in June. A workflow platform went agentic across major ATS tools. A newly funded rival started targeting APAC and offshore hiring.

WHY VOICE ALONE LOSES

Everyone **passes** the voice test.

If your test is "does it do voice?", the answer is yes almost everywhere. That makes voice a feature, not a moat.

— WHERE THE GAP IS

Three places still differ.

- 1 Agentic depth.** Does the next question change based on what the candidate just said?
- 2 Role simulation.** Does it test how someone performs the job, not how they talk about it?
- 3 Regional fluency.** Was it built for your candidates' accents, or retrofitted for them?

Ask these **before** the demo.

- 1** Does it adapt its next question, or run a fixed script with a voice wrapper?
- 2** Can it evaluate a real job task, not just answers about the job?
- 3** Is it built for your accents and pacing?
- 4** Does pricing scale down to SMB volume as well as up?
- 5** Does it sit inside your ATS, or need a workflow overhaul?

RESULTS FROM APAC

150 candidates in five days.

A Sri Lankan conglomerate screened that group in five days. The manual process used to take four to five weeks.

A management trainee programme processed 460+ applications and ran 96 AI interviews. It identified the top 2% and shortlisted 10.

NEXT STEP

See it on **one of** **your roles.**

Run a live role through Talvin next to your current process, then compare the shortlists.
