

Why APAC is ditching video for voice AI

The switch isn't about novelty.
It's about results that legacy tools can't match.

— THE PROBLEM

70%

**of screening interviews are
with unqualified candidates**

Video tools don't probe. They record a rehearsed answer to a scripted question — then hand you a stack of videos to manually review. That's not automation. That's asynchronous admin.

Video AI **fails** non-native speakers

Documented scoring failures for candidates across APAC's linguistically diverse markets.

Western-built platforms score pronunciation and tone — then penalise candidates speaking English as a second or third language. In a region like APAC, that's not a bug. It's a systemic hiring filter for the wrong thing.

— THE DIFFERENCE

Real-time. Adaptive. Two-way.

Voice AI doesn't record a performance. It conducts a conversation.

Talvin's AI agent asks contextual follow-up questions based on what the candidate actually says. Recruiters configure probing depth per question — Low, Medium, or High. Candidates can't rehearse their way through it. It's dynamic by design.

REAL RESULTS

5 days

**150 candidates screened.
Previously: 4–5 weeks.**

A Sri Lankan conglomerate ran high-volume screening across multiple roles using Talvin. The manual bottleneck was removed entirely — not by lowering the quality bar, but by eliminating the back-and-forth scheduling and manual video review.

Janashakthi Group · Sri Lanka

— REAL RESULTS

80%

less screening time.

488 resumes → 15 finalists in one week.

A tech company processed 488 applications, ran AI interviews, and produced 15 final-round candidates — all in 7 days. The hiring manager's description: "like having 10 recruiters working around the clock."
