

One team. Five markets.

Why high-volume hiring out of a regional HQ breaks in a way local hiring never does.

THE MISMATCH

The targets went **regional**. The team didn't.

One req for a support lead now pulls candidates from three countries at once — different fluency patterns, different salary bands, different availability windows.

The hiring targets scaled across borders. Recruiter headcount stayed where it was.

WHERE THE HOURS GO

70%

of first screening conversations, across the industry, are with candidates who turn out to be unqualified once a recruiter actually talks to them.

A lean regional team cannot absorb that ratio across five markets.

Confident isn't the same as **correct**

A generalist recruiter in one city, screening a backend engineer for a delivery centre in another, has no way to tell a strong answer from a well-rehearsed one.

That single blind spot decides who reaches the hiring manager.

THE FIX

Set the depth **per question**

Adaptive voice interviews follow up on what the candidate actually said, then throw a deliberate curveball. Drill-down depth is configured question by question.

Low

Medium

High

Go deep on the two questions that decide the role. Stay light on the rest. No technical background required to run it.

WHAT CANDIDATES SAY

4.2 / 5

average candidate satisfaction, collected after every completed interview — across accents, markets and time zones.

Screening at volume across five countries does not have to cost you employer brand in four of them.

YOUR MOVE

Three questions before the next regional req

Which two questions actually decide this role? Who on the team can tell a strong technical answer from a confident one? And what happens to the candidate in Jakarta who is free at 9pm?

Book a demo — run it on your next regional hiring round
