

What manual hiring really costs.

The invisible bill for screening at scale across APAC — and where AI screening actually pays it back.

THE HIDDEN WASTE

70%+

of screening interviews are with candidates who turn out unqualified.

For a team running 150 first-round screens a quarter, that's roughly 105 conversations that consume recruiter time and produce nothing. It isn't a talent problem. It's a filtering problem.

WHERE THE HOURS GO

6.5–9 hrs

of recruiter admin per single hire.

Reviewing CVs, scheduling calls, running phone screens, chasing replies, writing notes. Across 50 hires a quarter, that's 325 to 450 recruiter hours spent on process, not judgment — \$8,000 to \$18,000 a quarter in screening admin alone.

THE COST OF MOVING SLOW

42%

of candidates accept the offer from whoever responds fastest.

A 4–5 week screening cycle doesn't just waste recruiter hours. It quietly hands your best candidates to faster competitors. In Colombo, Kuala Lumpur and Manila, the people you actually want are off the market within days.

— PROOF, NOT THEORY

5 days

**to screen 150 candidates —
down from 4–5 weeks.**

That's what one Sri Lankan conglomerate saw after replacing manual phone screens with AI voice screening. Same cohort, a fraction of the time — and recruiters freed to spend their hours only on candidates worth the conversation.

THE BOTTOM LINE

\$65K–\$115K

**net annual saving for a team
hiring 100 people a year.**

70% less screening admin, unqualified candidates filtered out before a recruiter ever joins the call, and a 30–45% drop in turnover from role simulations. Conservative assumptions — higher-volume teams see proportionally more.

— RUN YOUR OWN NUMBERS

Add it up honestly.

The full ROI breakdown — recruiter hours, unqualified screens, turnover costs, and where the returns actually land for APAC hiring teams.
