

Voice AI works. Accent AI doesn't.

The gap between a screening tool that works in APAC and one that quietly filters out your best candidates.

WHY THIS BREAKS

Built for **American** ears.

Most voice AI platforms were trained first on North American and European speech. Point them at an APAC candidate pool and the cracks show fast — transcription errors, missed context, scoring that penalises how someone sounds, not what they said.

Three failures, **one** root cause.

Qualified candidates score lower because the transcript came out wrong. **Candidate experience takes the hit** — nobody wants to feel misunderstood in an interview. **Recruiters stop trusting the shortlist** and start manually re-checking everything — which defeats the point of automating in the first place.

WHAT "APAC-NATIVE" ACTUALLY MEANS

Built in, not retrofitted.

Measured pace and neutral delivery. A two-way conversation that adapts to what a candidate actually says. Optional video capture — the hiring team's call, not the candidate's. Configurable probing depth per question: Low, Medium, High.

— MEASURED AFTER EVERY INTERVIEW

4.2/5

Talvin candidates' average satisfaction rating, collected after every interview. In a region where most platforms weren't built for the accents in the room, that's the real test — does it feel like a conversation, or a machine that failed to understand you.

— RUNNING IN PRODUCTION

488 resumes. 15 hires.

A Sri Lankan tech consultancy cut screening time by 80% and still hired better people. The same accuracy standard is already running inside a Sri Lankan financial conglomerate's 150-candidate, 5-day screen, and a management trainee programme that filtered 460+ applications to the top 2%.

"Talvin's voice assessments felt like having 10 recruiters working around the clock."

YOUR MOVE

Test it on your **own** candidates.

Not a demo script — your actual accents, your actual pipeline. That's the only test that tells you whether a screening tool actually works for the people you're trying to hire.

Book a demo — run it against your APAC hiring pool
